□ ABOUT US

- Construction
- Structural Glazing
- Finishing
- Waterproofing
- Restoration

SINCE 1990.....

LEAKSEAL is more than a word we coined to give a name to our business twenty eight years ago. Today **LEAKSEAL** stands for excellence in all fields of building activity- construction, structural glazing, finishing, waterproofing and restoration. The quality of work it has become a hallmark for, has restored to construction activity the status of an art. As a proud member of this **LEAKSEAL** team, it gives me pleasure to say a few words about us.

As the name suggests, we started our business as waterproofing contractors. The next step was to pioneer the restoration and rehabilitation of deteriorating structures, which prompted us to take on interior finishing work including marble and granite flooring, and external finishing work like dry cladding. With the kind of growth required for the expansion of our activities, we were poised to become a full-fledged construction company which we are proud to call ourselves today.

Our strength lies in our reputation for perfection which is backed by a proven track record, proven quality, expertise, workmanship, service, competence, guarantee, reliability, and most importantly, a commitment to excellence and customer satisfaction, which is substantiated by our impressive clients and projects.

While this is just an attempt to portray an essential part of our journey this far, we continue to move on, dotting our thirty- five year track record with beautiful and enduring milestones. At **LEAKSEAL** where we treat every project like a work of art, we do not believe there can be an end to a journey in quest of perfection and excellence.

Repair and Restoration of Maker Chamber VI, Nariman Point

Mumbai, India
Submitted by LeakSeal

Background of the Project

Maker Chamber VI is one of the most iconic commercial buildings located in Nariman Point, Mumbai. It is in the heart of the busiest business districts in India and home to reputed multi-national organizations such as Reliance, State Bank of India and also public bodies such as State Government House of Secretaries. Built in the year 1985, Maker Chamber VI building is a reinforced concrete structure which consists of Basement, Ground floor, Fifteen upper stories and 1 story mast section. The structure gives one of the best scenic views in the city which is sea facing and occupies more than 95 commercial offices to reputed organizations and bodies such as the Austrian Consulate and BMW to name a few. It was also rated as amongst the costliest commercial office building in India as per the Real Estate Value.

Project Conditions and Problems That Prompted the Repairs

Because the structure is a sea facing high-rise building, braving hostile coastal weather throughout the year, especially during the intense monsoon season of Mumbai when wind-driven acid rain attacked the exposed surfaces, conditions from salty water and air, ultraviolet rays and poor maintenance (the buildings was repaired & painted only once in 35 years), the concrete slabs & surface crazing of the external facade which also led to rapid corrosion and carbonation of the steel and concrete of the structure. A mandatory 30-year certification inspection suggested that the management team focus on immediate repairs to the structure's facade. Despite the fact that the building was constructed by one of the most respected contractors in India, poor timely maintenance and extreme weather conditions resulted in severe

OUR AWARDS

LOW-RISE CATEGORY

Apeejay House, Repair and Restoration

MUMBAI, MAHARASHTRA, INDIA
SUBMITTED BY LEAKSEAL

The Apeejay House, a reinforced concrete structure built in the early 1970s, is the exclusive corporate headquarters office for the Apeejay Surendra Group Mumbai Division. It consists of a ground floor and six upper stories.

Because the building faces the sea, the hostile marine environment, corrosion control conditions, and poor maintenance led to severe deterioration of the building's external concrete façade. In some locations, concrete

chunks started falling from beam and balcony areas. The sanitary installations were also leaking heavily—creating algal and fungal residues that were damaging the building, coupled with a potential health risk. Visible cracks on the external side of the building also contributed to leakage of water within the building.

It was determined that extensive restoration work was needed, including concrete repair, strengthening of structural members, corrosion protection, and the

WWW.ICRI.ORG

application of new sealants and coatings. The project consisted of repairs and replacement of major areas of the external façade, and repair to exposed portions of concrete elements, such as slab edges and columns. In addition, repairs included rehabilitation of the external façade treatment, replacement of façade render, repair/ replacement of concrete members/slabs, jacketing of columns, corrosion control, and casting of concrete cornices and delicate architectural elements, including application of an external synthetic plaster with a unique and innovative paint pattern to match the existing building appearance.

The entire repair, which took over one year to complete, had a 100% safety record with manpower working during day and night shifts on a daily basis including Sundays. Executing the work without disturbing the cars parked below and completing the façade work while keeping the offices fully functional in one of the busiest commercial districts in India were challenges that were overcome. The project was completed in May 2016 on schedule and under budget.
